The SRX-2000 Green Cut Early Entry Saw by MK Diamond Products

The SRX-2000 Green Cut Early Entry Saw is engineered for early entry sawing of crack control joints within one to two hours of concrete finishing. It is perfect for use on driveways, parking lots and residential projects.

“The importance of cutting control joints is you prevent random cracking caused by internal stresses that develop during the curing process,” states Brian Delahaut, Vice President MK Diamond Products, Inc. “These contraction joints, at predetermined locations, create weakened planes where the concrete can crack underneath the cut but appear as a straight line on the top of the slab.”

There are two SRX-2000 models, a pull start and electric start, both powered by a Honda GX 270 Air-Cooled 4-Stroke OHV 8.5hp Engine. The remotely mounted throttle and stop switch allow for quick operator access. The tach hour meter provides engine monitoring. The 10” blade capacity allows a depth of cut up to 1-5/8”. There is an easy release depth control lever for convenience. The SRX-2000 has an up-cut blade rotation, which facilitates in keeping debris out of the joint. The anti-spall, skid plate aids in keeping the edge of the joint smooth. The oil-bath blade shaft provides for maintenance free operations.

The blade guard features a 2-inch vacuum port for easy connection to dust control systems. The SRX-2000 has an easily removed blade guard cover providing quick access for blade changes and inspection. The folding handle bar and retractable pointer arm make the saw compact for storage. The 4-inch wide, polyurethane wheels are non-marking and provide increased stability. Remote mounted pointer control allows for full operation from the handlebar.

MK Diamond offers a full line of Early Entry Green Concrete diamond blades. The GC line of blades includes five blades that are engineered for the type of aggregate used in the concrete. They range from ultra hard aggregate to medium/soft aggregate and have a triangular shaped arbor.
